THE "MANUELLE GAUTRAND ARCHITECTURE" EXHIBITION ON THE SITE LE CORBUSIER IN FIRMINY

1,2,13. Manuelle Gautrand Architecture, exhibition at the Le Corbusier site in Firminy, France. 1. Exhibition layout.

Manuelle Gautrand

At the head of her Paris-based architecture office named in 1999, she is known for her sensitive approach to design.
Our exhibition takes place at the Le Corbusier Site in Firminy, France, from mid-June 2021 to mid-January 2022. It will introduce the Biennale Internationale Design Saint-Etienne 2022, whose main theme is “Bifurcations”, which might strike you as prophetic, given the 2020 we have just been through. Bifurcations is an opportunity to look at the roads open to us and choose where we want to go. It is an opportunity to change paths, explore, experiment, and change. So what roads are open to us?

The Le Corbusier site wanted to put the accent on architecture, and invited us to put together a monographic exhibition of our practice and work. We are going to take over the Church of Saint-Pierre in Firminy to present a selection of seven key projects, each examining the evolution of the city and its environmental challenges, such as the use of precious public space and the purpose of architecture. Architecture reflects a past, a culture and a view of the future. It weaves a story made up of successive bifurcations, guiding man and structuring his territory.

We have chosen three of the many possible bifurcations and explanatory paths that in our opinion are fundamental and guide the work of our practice, becoming one of the common threads running through our exhibition:

The question of public space (theme: The Gift of Public Space), at a time when cities under increasing real-estate pressure, tend to densify and privatise. Yet all European towns - to cite only these - are crafted from and around the public space that accompanied their birth, and which from time immemorial has been the bedrock of our sociality, our relations and our shared lives. The Roman forum still has its place today. The question of use (theme: The Program Laboratory), at a key time when each of us is questioning how we live, work, move around, and our more-or-less definite relationship with nature. How can architecture respond to these questions, how can it meet and anticipate our new needs? Finally, the question of the meaning of architecture versus that of its environmental impact (theme: Urban Markers). How can our architecture ensure minimum environmental impact, treating the planet with respect, even in terms of remediation, but at the same time convey meaning, emotion through architecture and enhancing each site? How can human activity and its footprint be effaced while ensuring that our cities are not, in the words of Victor Hugo, merely an name?

The Site Le Corbusier in Firminy
The Site Le Corbusier is a national public entity. It is the largest site in Europe in terms of the number and surface area of buildings by Le Corbusier, some of which UNESCO World Heritage sites. Our exhibitions will be held in this exceptional setting in the Church of Saint-Pierre, a double construction, the church sitting on top of exhibition and meditation spaces.

The power of this magical place is intimidating. The exhibition spaces lead to a circular promenade sliding the four façades before going below grade to form a series of amphitheatres running from one room to another.

Cinema to Explain Architecture
This series of newled seating has a powerful effect on the space, literally setting it in motion. The mate continually oscillates between the upper walkway and lower seating, between windows onto the landscape and spaces dug out of the ground.

Each room with its tiered seats will serve not only as an exhibition space, but also as a cinema. Each will show a film shot in the building and exhibited in that room. We commissioned a young filmmaker to make a mini-series, each episode telling a (fictional) story set in one of our five buildings.

Architecture is felt through motion. It must be explored and experienced to be understood. An integral part of the exhibition, cinema inhabits the exhibition spaces, casting a particular light on our projects. Filmmakers and architects are both creators of spaces. Cinemas are represented in films, just as film is a representation of the city. They dialogue and complete one another.

The quality of a work of film depends, among other things, on its capacity to thrive, on its respect and enhance the space through which it moves. It records the spatial quality of architecture and on a broader level - the city.

The quality of a piece of architecture also resides in its capacity to compose spaces that enhance our view of the city. Architecture accompanies the camera, suggesting movements, whispering frames, and marking out many of its dimensions.

An Exhibition Design Made Entirely from Recycled Materials
An exhibition is an ephemeral moment in a place that often will remain after the exhibition. We are no longer in the dimension of
the relative permanence of architecture, rather than that of a work created to last only a few months. We therefore decided to work using only recycled materials; giving them another life for the duration of the show. Once the exhibition is finished, they will again be recycled, in a kind of infinite lifecycle.

We then looked to Saint-Étienne’s fertile pool of craftsmanship and local companies to execute the exhibition design project. Materials and skilled labor are provided by two companies from the Rhône-Alpes region: Buitex and Marmonier.

Founded in the 19th century, Buitex has from the outset recycled materials giving them a second life, a highly innovative approach when started 100 years ago. The firm started by retrieving fabric discarded by Lyon’s silk manufacturers to use as heating fuel. Today, the company transforms what the planet uses most - jeans and plastic bottles - to make a material with multiple markers. We chose this material for its absorbent properties, as we had to make Le Corbusier’s spaces more comfortable, countering the cold and reverberation of the raw concrete. The amphitheaters have been equipped with little seating pads, while the projection of films required softer and more absorbent sound quality. Buitex supplied us with a very beautiful blueish material, which Marmonier then cut out to fashion small, made-to-measure rounded pads to cover the tiered seating and floors in the amphitheaters. As well as providing sitting comfort, they also act as sound dampeners.

The Three Topics of the Exhibition

1. The Gift of Public Space

Already at the end of the 19th century, Austrian architect and urban theorist Camillo Sitte was bemoaning changes to urban public space: “What can be done, when these days all the events of public life are discussed in the newspapers, where in the past, in Ancient Rome or Greece, we heard about them from town criers, at the baths, beneath the porticos or on the town squares? What can be done when markets are increasingly leaving market squares to be shut into utilitarian but unattractive buildings, or disappearing altogether and being replaced by home delivery [...]. Works of art, also, are increasingly abandoning the streets and the town squares to retire to those artistic pores that are museums [...] For centuries, but in particularly during our time, popular life has progressively withdrawn from public places, which have thereby lost a large part of their old significance”. Alongside this progressive reduction of public spaces, today we also have the reduction of their surface area for reasons that range from commercial and financial to security concerns. This restriction of citizens’ breathing space is happening even as the towns are being densified.

We have to accept this densification because we also want to minimize our footprint, limit distances and maintain the objectives of sustainable towns while meeting the needs of our growing populations and the fundamental requirement for decent housing. Yet, faced with this densification - which I prefer to call intensification - we cannot call it an intensification of public space. Public space must also grow and increase proportionally; we must give it our careful attention to ensure that its public place status remains non-negotiable, at no risk of privatization. Public space is not merchandise; it is a fundamental need we all share, the center of our community.

Public space is our most precious commodity; through which to weave our new modes of transport, install our places for play, exchange, releasing, places that must remain flexible, ready for uses that have not been anticipated or pre-calculated; space for freedom. The "porous" project in Saint-Étienne deconstructs the idea of city blocks as solid, enclosed things to be circumnavigated. Its form came from a dialogue with the existing urban grid, which it extends and draws right into its center to give the inhabitants of Saint-Étienne a new street, a new town square, a new traboule - the secret covered passageways found in the towns and cities of the area. The block is opened up, devoid of barriers, allowing inhabitants to walk through, appropriate and see it as a natural extension of their public space.

In this project, the void is on a par with the built mass, equally expressive and generous, deeply linked to the city. In addition, these public spaces must be imagined in three dimensions, not simply in plan. In Stockholm, the challenge for our project was not just vertical extension and densification but also the “programmatic” interstice we created between old and new.

The quality of the project is largely illustrated by this "in-between", the threshold between the existing and the new that is a direct extension, in three dimensions, of the surrounding public space. Its functions include a public balcony looking over the city, a café and a restaurant, as well as coworking spaces and public lounge areas. The balcony provides another opportunity to admire the unique

silhouettes of the city known as the “Venice of the North”.

Finally, our architecture must also ensure a fluid progression between public and private, avoiding the creation of private spaces that appear imposing and hostile to public space.

This is the whole challenge of the project in Pamirum, whose meaning is referential to the path of the sun so that the square situated to the north is never in shade—a reason of belonging it to life and making it the heart of the town. Facing onto this square, the project was careful to remain completely open on the ground floor, only housing uses that require no security, and so becoming a fluid extension of the square, where one can simply sit and rest, shelter, read a newspaper or have a coffee.

Today, faced with the privatization of new commissions for buildings and towns, public space is becoming the last bastion of the challenges of our time: the substratum of a reconsidered landscape, the foundation of new models of transport, and the structure underpinning exchange and sharing between individuals.

Public space must be the focus of all our creativity in the way we use and experience it.

2. The Program Laboratory:

The client’s brief is one of the “soft materials” in the conception of a project. As well as expressing material results, a brief also makes more sensitive, subjective, less easily quantified demands that cannot be summarised simply in terms of “what” or “how many”.

For each project, I like to analyse and question the brief to tease out the essential requirements, but also to draw out the hidden ones, probable long-term, related requirements—unanticipated yet fundamental. It is by combining all these requirements that specific situations of use and spatial arrangements become part of the design process. They bring singularity and richness to the urban forms and social interactions. They give a depth to the project, layers of uses in which it will be inhabited, experienced and appropriated by users.

They also enable greater project flexibility. Architecture that quickly becomes obsolete in often single-use architecture that leaves no room for appropriation, evolution, or the unforeseen.

With the Bellerhi project in Montpellier, we chose maximum diversity of use, making the building a place that is alive night
and day. The notion of time is important; the urban block is transformed into an organism with the capacity to be reversible in the long and short term. For me it is vital that a single space can, for a year or for a day, meet the needs of several programs or uses, and therefore several groups of people. Density, which I would call intensity, is not only spatial; it is also temporal.

The urban living room takes all its force from this diversity, combining hospitality, office and residential functions. It becomes the center of the project and the meeting place for different programs, each seeing it as an extension of their own particular needs. Public space is on voids in cities, urban squares, and the living-rooms in our homes.

Alongside permanent diversity, every project must have in-built flexibility. Here, our project for the Forum Jean-Marie Zoellé in Saint-Louis clearly illustrates this quest for true flexibility. Since a cultural project is a brave and costly investment for a city, it must be malleable, able to accommodate uses tomorrow that we cannot foresee today. The result is a project resembling a Swiss Army knife.

There are two large halls, surrounded by support functions able to meet a range of requirements: sport, culture, parties, events, and trade fairs, to name but a few.

Finally, our practice always aims to give something extra: empty space, ready for appropriation by residents, a breathing space, a free space. In our Edison Lite residential building, we decided to build 30% extra surface area, extra spaces, reserved for building residents to be used for gardening, socialization, cook-outs, group yoga sessions or a table-tennis competition in the DIY workshop. Distributed up through the full height of the building, they form a promenade through the residence, successively achieving one of the project's goals: to combine private and communal areas and enhance porosity between private and public space.

Just as in "useful spaces", these "voided spaces" are considerably more important than might appear. Often incorrectly described as residual space (space without a specific function between two specific function arrangements), these voids are in fact unexpected spaces, often poetic, and above all fertile. They become the substance from which emerge, more or less spontaneously, the public spaces of our cities.
3. Urban Markers

In the words of the French philosopher Henri Maldiney, “It is architects, urban planners and engineers who are responsible (at least most visibly) for the spatial structures of our environment, through which we communicate with other human beings, with things and with ourselves in a world. By calculating space, they engage man in a rhythm, or convulsions him to an irregular rhythm, which not only marks the coherence of his actions and the tone of his mood, but also animates him within a realm of meaning.”

This non-quantifiable dimension of architecture is fundamental. It is this that gives real meaning, creates emotion, and makes our memory. What, for example, would cinema be without hunger, suspense, or worse, without emotion?

Thus, with the salvation of our planet in mind, our architecture must succeed in achieving a combination of minimum environmental impact while giving real meaning, establishing the client’s belief and enhancing each site. It must continue to embellish our cities, stimulate our dreams and provide us with “shelter” in spaces of which we are proud.

Building on existing structures creates wonderful encounters between old and new. This was the aim of our Swedish project. Extending the existing building by architects Tengbom and Salmun, enhancing and adding to it, incorporating it into the sculptural roofline of Stockholm and erasing, opposed to the heart of the city, a real urban landmark in a district that did not yet have one. Similar to acupuncture, the project reawakens a dormant place, which in turn remakes the whole neighborhood.

Where the brief or site requires, architecture takes on the role of developing a local landmark for inhabitants, the marker of a neighborhood, the symbol of a community.

With its almost continuous green roof, our Edison Lite project also creates a kind of urban marker, one that initiates the return of nature to the city by bringing some 6,000 plants into the middle of a highly mineral neighborhood. We created and nurtured this green landmark well before the arrival of the residents who, finding an abundance of natural vegetation, moved in with humility and respect. By acknowledging the town’s industrial context, the Forum in Saint Louis, in the east of France, takes on a powerful identity and gains charisma. It is one of the nerve points of the city (the “nerves” of antiquity), a community space open to a wealth of organizations, sports and festive activities, artistic and cultural events and economic endeavor. It facilitates exchange and sharing, the driving forces behind cognitive creation.

Over the years, the neighborhood has become hummed in by an increasingly varied range of activities as it gradually abandoned whole swathes of its industrial heritage. Progressively emptied of its history and character, it needed to find a new focal point and become an object of pride and a new unifying landmark.

We wanted to produce a project that was economical, but also big in its ambitions, do the most with the least, develop a new communal space for inhabitants, like a kind of living room or games room, a place to meet, debate and exchange, a place for festivities where they share mostly everything they have in common: sport, theater, art, dancing, parties, literary festivals, concerts and so forth.

In Parmaman, the primary aim of our Agents 2.0 was to avoid blooding the path of the natural light, allowing the city square in front of the building to remain bathed in sun all year round. This resulted in an unexpected form that highlighted each level of the library like a succession of balconies looking over the square. None of the other surrounding buildings - mostly tower blocks - respects the path of the sun, plunging the square into the shade. In their midst, our building stands out, proclaiming its vocation as a public amenity and currently standing apart from the rest as a magnificent urban landmark.
